

exception

```
classDiagram
    class exception {
    }
    class OperationCanceled {
        + what()
    }
    exception <|-- OperationCanceled
```

The diagram illustrates a class hierarchy. At the top is a class named 'exception', represented by a rectangle divided into three horizontal sections. The top section contains the text 'exception', while the two sections below are empty. Below the 'exception' class is a class named 'OperationCanceled', also represented by a rectangle divided into three horizontal sections. The top section contains the text 'OperationCanceled', the middle section is empty, and the bottom section contains the text '+ what()'. A blue arrow with an open triangular head points from the top edge of the 'OperationCanceled' class to the bottom edge of the 'exception' class, indicating that 'OperationCanceled' inherits from 'exception'.

OperationCanceled

+ what()
