

exception

```
classDiagram
    exception <|-- ClassNotFoundError
    class ClassNotFoundError {
        + what()
    }
```

The diagram illustrates a class hierarchy. At the top is a class box labeled 'exception'. It has three horizontal compartments: the top one contains the name 'exception', and the other two are empty. Below it is a class box for 'ClassNotFoundError'. This box has three horizontal compartments: the top one contains the name 'ClassNotFoundError', the middle one is empty, and the bottom one contains the method '+ what()'. A blue arrow with an open triangular head points from the top of the 'ClassNotFoundError' box to the bottom of the 'exception' box, indicating that 'ClassNotFoundError' inherits from 'exception'.

ClassNotFoundError

+ what()
